

Good and bad interfaces design

Bad design example

Objective of application:

Application should be used to order food from the restaurant.

Bad sides of app:

- Some of the text is duplicated – this aspect makes the page less readable and more chaotic
- Poor pick of colours – colours which are used to develop this app make it not so attractive
- Text in buttons is not lying in one line – it makes app looking a bit amateur

- Too much buttons in one place – gaps between buttons should be bigger to make page clearer, maybe buttons should be deployed in bigger area

Proposed improvements:

- Delete duplicated text
- I would pick colours which are more in one tone and without big contrast between them
- Fix implementation details, put text in buttons in one line
- Change layout of buttons to make page looking transparent

Good design example

Objective of application:

Bolt food - app also is used to order food from restaurants.

Good aspects of application:

- Although there is a lot of content and text, application looks clear
- Content is divided in more sections, that makes information more visible
- Pick of colours – used colours looks good and don't distract the user
- Pick of text size and font – makes information easy to read
- Layout of the page is really well made and it cares about details
